How to make a correct form? I have one form template, I have some fields, User will fill them, send the form and my application will analyse the fields, generate a specific answer, based on some conditions and return the answer to the user. But I want to make my form to be more user friendly, How to make it looks good? - images, icons, how to make it look better? How is best practice to do something like this? A: The UX book written by Steve Krug says a lot about the right way of designing your form. These are the rules of thumb I use: - Have a good use-case and keep the form relatively short. - If the form is shorter, then the user can complete it within one session. - The additional fields can be hidden or shown on demand. - Keep the user on the page (e.g., by giving him the chance to save a draft if needed). - Keep the user's actions in the user's control. Q: The fastest algorithm to find number of duplicates in a list? I have a list of 10 million elements, and I need to find the number of duplicates. That is, given the input list = [1,2,3,4,5,6,5,7,8,9] the algorithm should output => 2 As I get the input from text file, I'm using `itertools.groupby()` There are lots of duplicates in my input, but I need to get the exact number. But I use an inefficient algorithm to get it, and it takes 15 minutes to get one duplicate. It would be more efficient if I can complete the task in 0.5 seconds. I tried a naive algorithm like this:

```
from itertools import groupby
def f1(inputList):
    inputList = list(inputList)
    c = [0 for i in xrange(len(inputList))]
    f1 82138339de
```
